Summary:

Area	Before Result	After Result	Improvement
Page Load Time	9.7 seconds	2.5 seconds	74% reduction

Area	Before Result	After Result	Improvement
Page Speed Score	51%	96%	45% increase
Image Alt Text	Missing in several images	All images now have descriptive alt text	Implemented
Duplicate Title Tags	Present on multiple pages	Resolved	Eliminated

Before: Identified Issues

Before: Identified Issues

Our preliminary assessment of the system has brought to light a number of significant performance and user interface problems that require immediate attention and resolution to ensure optimal user experience and efficient operation. These issues span various aspects of the application, from front-end optimization to styling consistency.Performance Concerns.

Redirection Issues:

- **Issue**: Improper or excessive redirects were identified.
- **Impact**: Unnecessary redirects can slow down page load times and disrupt user experience.

Duplicate H1 and Title Tags:

- **Issue**: Some pages had identical H1 and title tags.
- **Impact**: Duplicate tags can confuse search engines and dilute keyword relevance, affecting SEO performance

Missing Image Alt Text Attributes:

- **Issue**: Several images lacked alt text, which is essential for accessibility and SEO.
- **Impact**: Missing alt attributes can hinder search engine understanding of image content and reduce accessibility for users relying on screen readers.

Page Speed and Web Vitals:

- **Slow Page Load Times:** A critical performance bottleneck stems from the inefficient delivery of front-end assets. Specifically, the failure to minify CSS and JavaScript files results in larger file sizes that require more time for browsers to download and parse. This directly translates to increased page

load times, negatively impacting user patience and potentially increasing bounce rates.

- **Extended Load Times and High Bandwidth Consumption:** Another contributing factor to slow loading and increased resource usage is the presence of unoptimized images throughout the application. Large, uncompressed image files demand significant bandwidth and take longer to download, further delaying the rendering of pages and potentially incurring higher data transfer costs.

- **Increased Rendering Time due to Bloated Modules:** The current implementation includes modules that contain a substantial amount of unused code. This code bloat inflates the size of the JavaScript bundles, leading to longer processing times by the browser and consequently delaying the rendering of interactive elements on the page.User Interface and Experience Issues

- **Layout Shifts and Inconsistent Spacing:** Users are experiencing distracting layout shifts and inconsistencies in spacing across different screen sizes and devices. These inconsistencies create a jarring visual experience, hinder usability, and indicate a lack of responsive design principles in certain areas of the application.

- **Browser Performance Degradation:** The presence of numerous console warnings and errors suggests underlying issues within the codebase. These errors not only indicate potential functional problems but also negatively impact browser performance as resources are consumed by logging and error handling processes.

Here is a summary of the identified performance issues:

Area	Initial Finding
Page Load Time	9.7 seconds
Page Speed Score	51%

Area	Initial Finding
Image Alt Text	Missing in several images
Duplicate Title Tags	Present on multiple pages

SEO Fixes & Imrovements

Image Optimisation:

- Added descriptive alt text to all images and compressed image files without compromising quality.
  Result: Enhanced accessibility and faster image loading times.

Resolved Duplicate Tags:

- Reviewed and updated H1 and title tags to ensure uniqueness and relevance.
  Result: Improved clarity for search engines and better keyword targeting.

Fixed Redirection Issues:

- Streamlined redirect chains and ensured proper 301 redirects where necessary.
  Result: Reduced page load times and improved crawl efficiency.

Page Speed and Web Vitals:

- **CSS Minification -** We minified all CSS files to reduce file size and eliminate redundant code.
  Result: Faster rendering and cleaner DOM, with consistent styling across devices.

- **JavaScript Minification -** All JavaScript files were minified and deferred where possible to avoid render-blocking.
  Result: Faster interactivity and reduced time to first paint.

- **Module Cleanup -** Unused modules, fields, and legacy styles were removed or merged.
  Result: Lighter HTML structure, faster CMS rendering, and improved maintainability.

- **Image Optimization -** Compressed images without loss in quality and converted assets to modern formats (like WebP where supported).
  Result: Reduced page weight and improved LCP (Largest Contentful Paint).

- **Console Issue Resolutions -** All console warnings and errors were addressed, particularly ones from script conflicts or undefined functions.
  Result: Clean runtime environment and improved dev tools readability.

- **UI & Layout Fixes -** Spacing inconsistencies, alignment issues, and responsiveness problems were resolved.
  Result: A polished and user-friendly interface across all screen sizes.

- **SEO & Accessibility Enhancements -** Basic SEO structure was improved, and ARIA roles and semantic HTML tags were reviewed for accessibility.
  Result: Improved crawlability and user experience for all visitors.

Results and Improvements

Area	Final Result	Improvement
Page Load Time	2.5 seconds	74% reduction
Page Speed Score	96%	45% increase
Image Alt Text	All images now have descriptive alt text	Implemented
Duplicate Title Tags	Resolved	Eliminated

Areas for Improvement

Metadata Optimization

Overlength Meta Descriptions

- Problem: 27 pages have meta descriptions longer than 155 characters.
- Fix: Shorten them to avoid text being cut off.
- Benefit: Makes listings look cleaner and more readable.

Link Optimization

Generic Anchor Text

- Problem: 3 pages use vague link text (like “Read more”).
- Fix: Use detailed, meaningful link text that describes the destination page.
- Benefit: Improves navigation and SEO signals.

Make your link anchor text more descriptive (3)

In a link, anchor text is the clickable word or phrase. It's important for the anchor text to clearly communicate what you're linking to. Try to avoid using generic anchor text such as "click here" or "click this."

Mobile SEO Improvement Report

This report details the recent improvements made to enhance mobile SEO performance, specifically focusing on LCP preloads and image optimization.

Mobile SEO Enhancements

Image Optimization

Result: Reduced page weight, faster loading times, and improved user experience on mobile.

LCP (Largest Contentful Paint) Preloads

Result: Faster initial rendering of content, leading to a smoother user experience and better performance metrics.

Specific Actions Taken

1. **Modern Image Formats:** Converted all relevant images to WebP format to reduce file size and improve loading speed.
2. **Responsive Image Implementation:** Implemented srcset attributes for images to ensure appropriate sizes are loaded on different screen resolutions.
3. **Image Compression:** Compressed all images to reduce file size without losing significant quality, thereby improving download times.
4. **LCP Resource Identification:** Identified the main images and critical CSS/JavaScript that contribute to LCP.
5. **Preload Directives:** Added `<link rel="preload">` tags in the `<head>` of the HTML to preload identified LCP resources.

Sustained.com – SEO, UX & Lead Generation Audit (High Impact Issues)

SEO & Content:

- Page titles, meta descriptions, and heading structure (H1–H3) are inconsistent, which hurts search visibility.
  Fix: Write clear, keyword-rich meta titles and descriptions, use one H1 per page, and link blog posts to key pages like “Solutions” and “Demo.”

Keyword Strategy:

- The content focuses too much on products instead of what people search for. Important topics like LCA, product footprinting, compliance, and sustainability intelligence aren’t targeted.
  Fix: Create content clusters around these topics to capture both informational and commercial searches.

Conversions:

- Calls-to-action (CTAs) are too generic, and there aren’t enough downloadable resources for leads in the middle of the funnel.
  Fix: Add CTAs based on user intent, and create gated assets like reports, calculators, or checklists to capture qualified leads.

UI/UX:

- The homepage has too many CTAs competing for attention, and the navigation menu is vague.
  Fix: Choose one main CTA above the fold and make menu labels more benefit-focused (e.g., “Solutions,” “Use Cases,” “Resources”).

Trust Signals:

- Case studies, testimonials, and certifications aren’t visible near key conversion areas.
  Fix: Highlight case studies with real metrics and display trust badges close to CTAs.

Performance:

- Large images and videos may slow down load time.
  Fix: Compress images, enable lazy loading, and optimize for better speed through HubSpot.

Quick Wins (Low Effort, High ROI):

- Improve title tags and meta descriptions on top pages.
- Add CTAs inside blog posts and use exit-intent popups for lead magnets.
- Use HubSpot Smart CTAs based on user lifecycle or location.
- Set up progressive profiling and lead scoring in HubSpot.
- Test different CTA text and placement on key landing pages.
