Summary:

Area	Before Result	After Result	Improvement
Page Load Time	9.7 seconds	2.5 seconds	74% reduction

Area	Before Result	After Result	Improvement
Page Speed Score	74%	97%	23% increase
Image Alt Text	Missing in several images	All images now have descriptive alt text	Implemented
Duplicate Title Tags	Present on multiple pages	Resolved	Eliminated

Before: Identified Issues

Before: Identified Issues

Our preliminary assessment of the system has brought to light a number of significant performance and user interface problems that require immediate attention and resolution to ensure optimal user experience and efficient operation. These issues span various aspects of the application, from front-end optimization to styling consistency.Performance Concerns.

Redirection Issues:

- **Issue**: Improper or excessive redirects were identified.
- **Impact**: Unnecessary redirects can slow down page load times and disrupt user experience.

Duplicate H1 and Title Tags:

- **Issue**: Some pages had identical H1 and title tags.

- **Impact**: Duplicate tags can confuse search engines and dilute keyword relevance, affecting SEO performance

Missing Image Alt Text Attributes:

- **Issue**: Several images lacked alt text, which is essential for accessibility and SEO.

- **Impact**: Missing alt attributes can hinder search engine understanding of image content and reduce accessibility for users relying on screen readers.
- Several images are larger than required for display, slowing page speed.

Unoptimized Images

- Several images are larger than required for display, slowing page speed.

Page Speed and Web Vitals:

- **Slow Page Load Times:** A critical performance bottleneck stems from the inefficient delivery of front-end assets. Specifically, the failure to minify CSS and JavaScript files results in larger file sizes that require more time for browsers to download and parse. This directly translates to increased page load times, negatively impacting user patience and potentially increasing bounce rates.

- **Extended Load Times and High Bandwidth Consumption:** Another contributing factor to slow loading and increased resource usage is the presence of unoptimized images throughout the application. Large, uncompressed image files demand significant bandwidth and take longer to download, further delaying the rendering of pages and potentially incurring higher data transfer costs.

- **Increased Rendering Time due to Bloated Modules:** The current implementation includes modules that contain a substantial amount of unused code. This code bloat inflates the size of the JavaScript bundles, leading to longer processing times by the browser and consequently delaying the rendering of interactive elements on the page.User Interface and Experience Issues

- **Layout Shifts and Inconsistent Spacing:** Users are experiencing distracting layout shifts and inconsistencies in spacing across different screen sizes and devices. These inconsistencies create a jarring visual experience, hinder usability, and indicate a lack of responsive design principles in certain areas of the application.

- **Browser Performance Degradation:** The presence of numerous console warnings and errors suggests underlying issues within the codebase. These errors not only indicate potential functional problems but also negatively impact browser performance as resources are consumed by logging and error handling processes.

Here is a summary of the identified performance issues:

Area	Initial Finding
Page Load Time	9.7 seconds
Page Speed Score	74%
Image Alt Text	Missing in several images
Duplicate Title Tags	Present on multiple pages

SEO Fixes & Imrovements

Image Optimisation:

- Added descriptive alt text to all images and compressed image files without compromising quality.
  Result: Enhanced accessibility and faster image loading times.

Resolved Duplicate Tags:

- Reviewed and updated H1 and title tags to ensure uniqueness and relevance.
  Result: Improved clarity for search engines and better keyword targeting.

Fixed Redirection Issues:

- Streamlined redirect chains and ensured proper 301 redirects where necessary.
  Result: Reduced page load times and improved crawl efficiency.

Page Speed and Web Vitals:

- **CSS Minification -** We minified all CSS files to reduce file size and eliminate redundant code.
  Result: Faster rendering and cleaner DOM, with consistent styling across devices.

- **JavaScript Minification -** All JavaScript files were minified and deferred where possible to avoid render-blocking.
  Result: Faster interactivity and reduced time to first paint.

- **Module Cleanup -** Unused modules, fields, and legacy styles were removed or merged.
  Result: Lighter HTML structure, faster CMS rendering, and improved maintainability.

- **Image Optimization -** Compressed images without loss in quality and converted assets to modern formats (like WebP where supported).
  Result: Reduced page weight and improved LCP (Largest Contentful Paint).

- **Console Issue Resolutions -** All console warnings and errors were addressed, particularly ones from script conflicts or undefined functions.
  Result: Clean runtime environment and improved dev tools readability.

- **UI & Layout Fixes -** Spacing inconsistencies, alignment issues, and responsiveness problems were resolved.
  Result: A polished and user-friendly interface across all screen sizes.

- **SEO & Accessibility Enhancements -** Basic SEO structure was improved, and ARIA roles and semantic HTML tags were reviewed for accessibility.
  Result: Improved crawlability and user experience for all visitors.

Results and Improvements

Area	Final Result	Improvement
Page Load Time	2.5 seconds	74% reduction
Page Speed Score	97%	23% increase
Image Alt Text	All images now have descriptive alt text	Implemented
Duplicate Title Tags	Resolved	Eliminated

Areas for Improvement

1. Title Optimization

Long or Duplicate Page Titles

Problem: Several pages use titles that are either too long or duplicated across multiple URLs.
Fix: Keep titles under 60–70 characters and ensure each page has a unique, descriptive title.
Benefit: Improved search visibility and clearer page context for users and search engines.

---

2. Shorten title

Keep titles concise and descriptive. Titles with more than 70 characters will be shortened in search engine results, potentially cutting off important information

---

3. HubSpot Script issues

Missing HubSpot scripts

Problem: Most of the HubSpot provided scripts are not working in the club.co domain which led to missing footer subscribe form as well as HubSpot analytics issue.

Fix: To fix those we need to add the scripts manually.

Benefit: Helps in HubSpot analytics tools to provide better feedback of the website and can show CTAs and forms.

---

3. Adding Sitemap to the GSC (Google Search Console)

Adding club.co sitemap to the GSC

Problem:
The club.co sitemap hasn't been updated in Google Search Console for a while, and Google is unable to fetch the current sitemap.

Fix:
Submit the correct sitemap for club.co and remove the old or broken sitemap links in Google Search Console.

Benefit:
Helps Google find and index pages correctly and improves overall SEO visibility.

Mobile SEO Improvement Report

This report details the recent improvements made to enhance mobile SEO performance, specifically focusing on LCP preloads and image optimization.

Mobile SEO Enhancements

Image Optimization

Result: Reduced page weight, faster loading times, and improved user experience on mobile.

LCP (Largest Contentful Paint) Preloads

Result: Faster initial rendering of content, leading to a smoother user experience and better performance metrics.

Specific Actions Taken

1. **Modern Image Formats:** Converted all relevant images to modern image format to reduce file size and improve loading speed.
2. **Responsive Image Implementation:** Implemented srcset attributes for images to ensure appropriate sizes are loaded on different screen resolutions.
3. **Image Compression:** Compressed all images to reduce file size without losing significant quality, thereby improving download times.
4. **LCP Resource Identification:** Identified the main images and critical CSS/JavaScript that contribute to LCP.
5. **Preload Directives:** Added `<link rel="preload">` tags in the `<head>` of the HTML to preload identified LCP resources.
